

TheraBreath Lakewood Sensory Validation Plan

One-page framework for validating taste consistency across manufacturing sites. Prepared for July 2026 Workshop

OBJECTIVE Confirm whether Lakewood-produced mouthrinse is sensorially equivalent to current-site production and, if not, define the difference and determine whether it is meaningful to consumers.

SAMPLE SET

Key variants for validation:

- Invigorating Icy Mint
- Mild Mint
- Rainforest Mint
- Healthy Gums Clean Mint
- Anticavity Sparkle Mint
- Overnight Chamomile Mint
- Complete Revitalizing Mint

Control variables as tightly as possible:
same formula, same flavor, matched age, storage, and coded presentation.

PHASE 1 Expert Sensory Screen

Blind expert evaluation comparing current-site and Lakewood samples by variant. Screen aroma, sweetness, mint impact, cooling onset, cooling duration, bitterness, medicinal notes, aftertaste, mouthfeel, and overall similarity.

PHASE 2 Difference Testing

Use a triangle test to determine whether panelists can reliably detect a difference between current-site and Lakewood-produced samples. Recommended for all key variants to establish a robust, decision-useful data set.

PHASE 3 Descriptive Profiling

If a difference is detected, quantify what is different. Profile attributes such as mint intensity, sweetness, cooling curve, bitterness, herbal character, medicinal notes, aftertaste, and mouthfeel.

PHASE 4 Consumer Validation

For priority or high-volume variants, confirm whether any detected difference is meaningful to consumers. Measure overall liking, freshness liking, flavor liking, aftertaste liking, and purchase intent.

TFF SUPPORT ROLE

- Sensory framework and test design
- Blind tasting scorecards and attribute language
- Sample coding and comparison protocol
- Result review and interpretation
- Root-cause flavor review if differences appear
- Flavor-related adjustment recommendations, if needed

RECOMMENDED EXECUTION Start with expert screen + triangle testing for all key variants, then escalate to descriptive profiling and consumer validation only where meaningful differences are observed.
